Laser Safety Inspections

Monitoring compliance is part of the Laser Safety Officer's duties, but the LSO may ask others to assist in carrying out inspections, for example, research supervisors and others with safety responsibilities.

Inspections should normally be carried out at least once a year.

Ask questions, look around, observe working practices and use a checklist like the one below.

Use your authority as LSO to stop work if necessary and follow up any necessary actions.

Others should be consulted as necessary, especially if you have concerns about hazards associated with the laser.

Give praise and encouragement where appropriate.

Report any significant findings to your safety committee.

Laser Safety Inspection Checklist

Lasers throughout the University vary widely in their application and control measures. The following detailed checklist includes checks on work practices and control measures that are common to many laser applications. Please amend the form to suit you – add anything you think is relevant or simplify the form as necessary, and don't forget to follow up any actions.

Laser Safety Inspection Checklist

Inspection carried out by: Date:

| | | | OK? ✓, × or N/A | Comments |
|----|---|---|--------------------|----------|
| 1. | Risk Assessment | Does the risk assessment appear to be suitable and sufficient | | |
| | | Does it cover all laser activities including alignment | | |
| | | Have necessary actions been implemented | | |
| | | Has the risk assessment been reviewed within the last year and revised when necessary | | |
| | Local rules | Are these documented following the format in University policy | | |
| 2. | | Do they contain contingency plans, brief description of work, control measures, procedures covered? | | |
| | | Have local rules been reviewed within the last year and revised when necessary | | |
| | For Normal use | Are Safe working procedures in operation | | |
| 2 | | Are they documented either in the local rules or separately | | |
| 3. | | Have possibilities of faults occurring or misuse considered | | |
| | | Have possible inadvertent reflections been assessed | | |
| | For procedures where risk is greater than during normal use (e.g. alignment, maintenance) | Are Safe working procedures in operation | | |
| 4. | | Are they documented either in the local rules or separately | | |
| 5. | Are engineering controls utilised as far as practicable | | | |
| 6. | Is justification for open beams included in risk assessment | | | |

| 7. | Are all enclosures secu | urely fixed | | |
|-----|--|---|--|--|
| 8. | Are all optical components securely fixed | | | |
| 9. | Is key control maintained (keys must not be left in unattended laser equipment) | | | |
| 10. | Are suitable administrative control measures in place Is there evidence that these are followed (e.g. from observations of work carried out if applicable) | | | |
| 11. | Are others protected from hazards (e.g. are appropriate warning signs displayed and interlocks fitted if necessary) | | | |
| 12. | Are interlocks failsafe | | | |
| 13. | Is there evidence of maintenance of engineering controls (e.g. log book of regular checks on interlocks, shields, interconnections etc) | | | |
| 14. | Laser work and non-laser work separated and isolated (e.g. screen between laser work area and write-up area) | | | |
| | Laser working area designed with regard for safety | Is the layout suitable | | |
| 15. | | Has an assessment of NOHD been carried out | | |
| | | Are access arrangements and restrictions appropriate | | |
| 40 | Service work – done by external service engineers | Have any hazardous activities been identified | | |
| 16. | | Are appropriate arrangements in place for service work e.g. temporary restrictions on access | | |
| | Contingency plans | Are these documented in local rules | | |
| 47 | | Do they follow University policy | | |
| 17. | | Are they easily accessible | | |
| | | Are staff/ students aware of the arrangements (ask staff/students – what are the likely contingencies?) | | |
| 18. | Emergency arrangements | Are arrangements for Emergency-Stop in place | | |
| | | Has safe entry for security and emergency services been considered (e.g in the event of security investigating an alarm sounding?) | | |
| | | Are staff/ students aware of the arrangements (ask staff/ students – how would you quickly shut off the equipment in an emergency?) | | |

| 19. | Eye protection | Is appropriate eyewear readily available | | | | |
|-----|---|--|--|--|--|--|
| | | Is it maintained in good condition | | | | |
| | | Is it appropriately marked (CE and according to EN 207/EN 208) | | | | |
| | | Is there evidence that eyewear is used when necessary (carry out spot checks if necessary) | | | | |
| | Any other checks | | | | | |
| 20. | . Check Interconnections for electricity, water, gases | | | | | |
| 21. | Control measures in place for laser dyes | | | | | |
| 22. | Risk assessments in place for other hazardous activities | | | | | |
| 23. | Is the laboratory free from clutter (particularly optical benches and walkways) | | | | | |
| | Other Comments: | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

List of Actions Required

| Action | Name of person responsible | To be completed by (agreed date) | Completed? (date/ signature of LSO) |
